Follicular Mucinosis = اﻠﺠراﺒﻲ اﻠﻤﺨاﻄﻴﻨﻲ اﻠداء
There are six types of cutaneous mucinosis: (a) generalized myxedema, (b) pretibial myxedema, (c) lichen myxedematosus or ichthyoid myxedema, (d) erythematous mucinosis or plaquelike mucinosis, (e) self­healing juvenile cutaneous mucinosis, and (f) scleredema.
Follicular Mucinosis = اﻠﺠراﺒﻲ اﻠﻤﺨاﻄﻴﻨﻲ اﻠداء

Regular demonstration of the presence of mucin in the dermis is possible only in pretibial myxedema, self-healing... amount of mucin usually is too small to be demonstrable, and in scleredema, mucin may be present only in the early stage.

The mucin found in these six diseases represents an increase in the mucin that is normally present in the...
The mucin present in the six types of mucinosis stains a light blue in sections stained with H&E. It also stains with Alcian blue. The mucin is completely removed on incubation of histologic sections with testicular hyaluronidase for 1 hour at 37°C.
